

PRE-SEED · 2026

rando

Meet the people around you — a live social layer over the real city.

- Live demo — randoirl.vercel.app · Itaewon, Seoul

every visual in this deck is the running product

Social media promised connection. It delivered scrolling.

- 01 **We are surrounded by people and talk to none of them.** A full bar, a full café, a full street — everyone on their phone, including you.

- 02 **Meeting someone new in real life has become genuinely rare.** Not because people stopped wanting it — third places lost their social scripts, and cold-approaching a stranger now reads as strange.

- 03 **No easy way exists to turn "we're in the same place" into a conversation.** Dating apps skip the room you're standing in. Social media shows you people you'll never stand near.

INSIGHT

The problem was never a lack of people. It's a lack of permission.

Every crowded district already has the supply — hundreds of people within a five-minute walk who would say yes to a conversation. What's missing is a socially acceptable *reason* to start one. Give two strangers a shared context and the approach stops being weird.

Rando manufactures that context, on location, in real time.

See who's nearby. Talk. Then walk over.

Live product – street level in 3D Itaewon. The characters are people who are actually there.

Open the app, see who's around.

Everyone nearby appears as an anonymous character in a 3D twin of the district.

Zone-level, never precise.

Location snaps to a named zone ("by the crossing"), never GPS coordinates. Visibility is opt-in and one tap to kill.

Talk before you meet.

Public feed and 1-to-1 chat mean the first face-to-face moment is a continuation, not a cold open.

Borrowed party-game mechanics, played in the real world

QUESTS

Mario Party, but in real life.

GPS-triggered missions strangers complete together — two-person tasks that only fire when you're both standing in the same place. The quest is the icebreaker; nobody has to invent an opening line.

LOBBIES

Jackbox, but in real life.

Themed 2D rooms tied to real venues. A group gathers in the lobby, a randomized minigame reveals itself, and the shared-room energy of a party game plays out — except the room is an actual bar or bookstore.

CHAT FIRST

Warm intros, not cold approaches.

In-app chat runs before, during, and after. You've already exchanged messages with the person across the room — walking over is step two, not step one.

A digital twin of the district — not a map with pins

4,471 real buildings from the Korean government building registry — true footprints, floor counts, and heights, not procedural filler.

Named venues & districts with day/night cycle matched to Seoul time.

Archetype NPCs — Chill, Chaos, Sporty — keep streets alive between users; more archetypes planned.

Venue-special quests — a real bar hands out a QR code as proof you finished its quest. The world is built to keep absorbing the real city.

The live world from above: Itaewon-ro and its alley network, rendered from government registry data.

Identity you own: one base character, endless variants

A full customization catalog is generated and already converted to rigged 3D: one skeleton, swappable hair / tops / bottoms / shoes, with color handled as material tints. All of it runs in the deployed app's engine.

Skin tones and hair colors – texture swaps on shared base meshes

Wardrobe: 10 bottoms, 6 shoes, tops

Auto-rigged 3D conversion (34-joint skeleton)

Every piece of this behavior already exists at scale

LOCATION LAYERS WORK

Pokémon GO proved hundreds of millions of people will walk city streets directed by a game layer — and that venues will pay to be part of it (sponsored PokéStops). Rando keeps the layer and makes the other players the point.

PEOPLE PAY TO MEET STRANGERS

Stranger-dinner apps (Timeleft), Bumble BFF, running crews — a fast-growing category of products whose only job is introducing strangers offline. Demand is proven; they all schedule it days ahead. Rando does it live, where you already are.

THE PROBLEM IS INSTITUTIONAL

Loneliness is now policy: the US Surgeon General's 2023 advisory, loneliness ministers in the UK and Japan. The gap between connectivity and connection is the defining social problem of this decade.

Venues pay for verified foot traffic.

Sponsored quests

A bar buys a quest slot; completing it requires being physically inside and scanning the venue's QR code. The venue pays for provable bodies in the room — not impressions.

District priority

Venues pay for placement in a district's quest rotation and labeled presence in the 3D world (their building, their name, their glow).

Cosmetics, later

The character system is the consumer monetization surface — outfits and archetype skins — switched on once density is proven, never before.

EXAMPLE UNIT

$$\left[\frac{\# \text{ venues } i}{\text{per district}} \times \left[\frac{\#}{\text{month}} \right] \text{ sponsorship} \right] \times \left[\# \text{ district-month} \right]$$

— priced against what venues already spend on promoters and portal ads.

10 strangers, one night, zero prompting

10

real strangers live in Itaewon in one night

1st

session produced organic public chat

WHAT HASN'T HAPPENED YET

In-person meetups converting from the app. That's a density problem, not a demand problem — with a handful of users spread across a district, no two are reliably in the same zone at the same time. It's exactly the gap the Itaewon-only launch is designed to close.

Everyone else schedules it, screens it, or skips it

Density playbook, not a waitlist

One district at a time with on-the-ground launch ops — the only strategy that survives the cold-start.

The world is a moat

Registry-data digital-twin pipeline rebuilds any city in days; competitors ship map pins.

Safety by architecture

Zone-coarse presence, anonymous handles, identity-verification (본인인증) scaffold already built.

In-house distribution

A founder who has grown audiences to 60k+ — launch content is a core competency, not a spend line.

Win one district, then copy the playbook

PHASE 1 · NOW

Itaewon only.

Concentrate every user in one nightlife district to hit real zone density. Weekly launch nights, venue-partner quests with QR proof, FXIENDS-style short-form content aimed at the district's actual crowd.

Success metric: strangers meeting in person from the app, every week.

PHASE 2

Seoul's districts.

Repeat district-by-district — Hongdae, Seongsu, Gangnam — each a contained density problem with its own venues and quest set. Same mechanics, new geography.

PHASE 3

Any city.

The stack is already city-agnostic: the world builds from public building-registry and OSM data, and quests/lobbies are templated per venue. District playbook + local content partner = a new city launch.

Two brothers: distribution and product

CEO · GROWTH & CONTENT

Emanuel Kong

Built Kingmaker Marketing from zero to **\$7k+/month** across 10+ clients.

Built FXIENDS to **60k+ TikTok** and **29k+ YouTube** followers — knows how to make a local scene show up.

CTO · ALL OF ENGINEERING

Tony Kong

Sole builder of everything in this deck: the 3D registry-twin engine, real-time presence and chat on Supabase, the safety/verification stack, and the generative character pipeline.

Ships daily; the demo is deployed and live right now.

Prove the loop in one district

Launch operations

Weekly Itaewon launch nights, venue partnerships, on-the-ground community seeding until zone density sustains itself.

Trust & safety

Korean identity verification (본인인증) integration and moderation — the foundation is built; the provider contract needs funding.

Product velocity

Quest/lobby content system, more archetypes, iOS/Android wrappers over the deployed web engine.

Milestone

Recurring stranger-to-stranger meetups every week in Itaewon — the number that unlocks district #2.

rando

Proximity is permission.

- `randoirl.vercel.app` – open it tonight, someone might be by the crossing
